Projects

- Client Landing Page

    - Collaborated with a client to design a responsive landing page, which uses gatsby Image to preload high quality stills of images that render depending on the width of the device being used.

    - Hosted the client's site with the library gatsby , and was styled using styled components and react useState.

    - Integrated graphql queries to dynamically display content.

- Movieflix

    - Built using create-react-app and hosted with Firebase, data was fetched from (TheMovieDB) Api in the form of JSONdata and then is dynamically displayed as per each fetch request parameter.

    - The site's purpose was to mimic the layout of "Netflix" and was achieved with the use of SASS to provide a responsive design on desktop and mobile.

- E-commerce Site

    - The project integrated the "Stripe" api to allow visitors a functional check out cart system that safely handles their transaction.

    - Site is paired with a vanilla javascript built and functional add to cart button system that allows users to add or delete items in their cart while updating the current display price.

Education

- California State University Sacramento

- Mt. San Antonio College
  (PHP programming , Web development)
